LEAD SERVICE VERIFICATION

MATERIALS NEEDED

Flashlight
Magnet
Flathead Screwdriver

HOW TO DETERMINE IF YOUR SERVICE IS LEAD

Locate the water service coming into your home. This will most likely be in your basement. Your incoming service could look like any of the below pictures.

STEP-BY-STEP INSTRUCTIONS

Once you have found the incoming pipe, follow the steps below.

1. Locate pipe test area. The area between the pipe coming into the building and the valve is the area where testing for a lead service needs to occur. If it is covered or wrapped expose a small area to test. Use your flathead screwdriver to scratch the pipe. **Make sure to scratch the piping before the valve and not the valve.**
2. Use the flat edge of the screwdriver and scratch through any outside corrosion on the pipe.
3. If the scraped area is shiny and silver, your service line is lead. A magnet will not stick to lead.
4. If the scraped area is copper, in color, like a penny, then your service line is copper. A magnet will not stick to copper.
5. If the scraped area remains a dull gray, and the magnet sticks to the pipe, then your service line is galvanized steel.

LEAD PIPE

COPPER PIPE

GALVANIZED STEEL PIPE
